Garden house painting and maintenance

Wood is a natural material, growing and adapting depending on weather conditions. Large and small cracks, colour tone differences and changes, as well as a changing structure of wood are not errors, but a result of wood growing and a peculiarity of wood as a natural material.

Unprocessed wood (except for foundation joists) becomes greyish after having been left untouched for a while, and can be turn blue and become mouldy. To protect the wooden details of your garden house, you must immediately process them with a wood preservative.

Attention! The house is supplied without elaborative workmanship. To reduce fire hazard you should use paints or impregnation substances that prevent fire from spreading! Use water-based paints and impregnation substances and avoid solvent-based products!

Consult a specialist regarding paints suitable for unprocessed softwood and follow the paint manufacturer's instructions.

It is not allowed to cover the product with lacquer or paint on which surface the flame spread rate is higher than 30mm/s.

After the house assembly is completed, we recommend for the conclusive finishing a weather protection paint that will protect wood from moisture and UV radiation.

When painting, use high quality tools and paints, follow the paint application manual and manufacturer's safety and usage instructions. Never paint a surface in strong sunlight or rainy weather.

Having been properly painted, your garden house's lifetime will increase substantially. We recommend that you inspect the house thoroughly once every six months.

Preparation for assembly

Tools and preparation of components

To assemble the garden house, you will need the following tools:

assembly aid

ladder

hammer

water-level

screwdriver

saw

knife

measuring tape

pliers

drill

ADVICE: To avoid splinters, we recommend that you wear the corresponding protective gloves during the assembly process.

We wish you total success with the garden house installation and much joy with this house for many years to come!

Installation

Begin by choosing a suitable location for the house. Make sure that there is enough space around the house both for playing and for regular inspection and maintenance of the house (recommended: at least 1 metre on all sides).

Since the foundation joists are in constant contact with the ground they must be treated with a special wood preservative.

Level the ground.

ATTENTION: Do not press the roof boards together too densely and you will avoid moisture-causing bulging! Leave an interval of about 1 mm between the boards to allow for swelling.

Depending on the climate at the house location, the floor boards can either swell or diminish. If the floor boards are very dry while the climate is damp, they will easily absorb moisture. In this case, the floor boards should not be attached very densely to avoid likely bulging. Leave some space (1-2 mm) between the floor boards to allow for swelling. But if your climate is warm and dry, you can install the boards densely because they will become drier and spaces may appear between them.

Maintenance

It is recommended to inspect the house thoroughly every 6 months. Regular painting of the house will prolong its useful life substantially.

You should also check the condition of the roof to discover any leaks as early as possible. Eliminate leaks as you find them to prevent rainwater from damaging the roof and other wooden parts of the house.

Make sure that all screws and bolts are firmly fastened. In lengthy periods of dry weather wood can shrink and the screw/bolt spots attachments can become weak. Conduct regular checks and tighten the screws/bolts as necessary!

Be especially attentive when checking barrier and door attachments.
